Instrument Characteristics

- The practical application channels are 2048, which is the only type of multi-channel Gamma Spectrometer in domestic at present.
- With four functions of powder sample measurement, non-destructive sample measurement, air radon measurement, soil radon measurement.
- Instrument uses Full-wave acquisition, and does not have apulse missing. It has the intelligent functions of baseline correction, interference identification and so on. Instrument receives PMT output signal directly, and does not have waveform distortion. It can get consistent resolution when Cs peak is put any channel within measurement range.
- The maximum data passing rate: > 333 kcps. It can be used to measure high activity radioactive samples without data missing.
- With the functions of visual display measurement, signal waveform, baseline online monitoring directly, real-time analysis of measurement results; Peak monitoring ensure the quality of acquisition data.
- Comprehensive analysis and solution of characteristic spectrum, full spectrum testing;
- With function of multi-line comparison, it can be used for research, teaching and technical training, etc.
- Using electric structure lead shielded room, it is time-saving when changing samples.
